(54) Title: HETEROARYL DERIVATIVES AS SEPIAPTERIN REDUCTASE INHIBITORS

(57) Abstract: Inhibitors of sepiapterin reductase of formula (I) or (I'), wherein the substituents are defined as in the claims, and uses of sepiapterin reductase inhibitors in analgesia, treatment of acute and chronic pain, anti-inflammation, and immune cell regulation are disclosed.

HETEROARYL DERIVATIVES AS SEPIAPTERIN REDUCTASE INHIBITORS

BACKGROUND

[0001] Tetrahydrobiopterin (BH4) is an enzyme cofactor for various aromatic amino acid hydroxylases, including phenylalanine, tyrosine and tryptophan hydroxylases, as well as being an important cofactor for other enzymes such as the nitric oxide synthases (inducible NOS (iNOS), endothelial NOS (eNOS), and neuronal NOS (nNOS)), and alkylglycerol monooxygenase. As such, BH4 is involved in regulating production of various neurotransmitters (e.g., serotonin and dopamine) and nitric oxide. Deficiencies in BH4 are associated with deficiencies in neurotransmitters including serotonin and dopamine. Reduced BH4 production is also associated with reduced pain sensitivity after injury.

[0002] The last step in the de novo pathway for BH4 biosynthesis is conversion of 6-pyruvoyltetrahydropterin to BH4 by the action of sepiapterin reductase. Sepiapterin reductase (SPR) is inhibited by the clinically approved drug sulfasalazine and other sulfa drugs, thereby interfering with the de novo biosynthesis of BH4.

SUMMARY

[0003] Disclosed herein are compounds of formulae I, I', II, II', III, IIP, IV, IV', V, and V', and pharmaceutically acceptable salts thereof:

[0004] Also disclosed are compositions (e.g., pharmaceutical compositions) comprising one or more of the compounds disclosed herein and a pharmaceutically acceptable carrier.

[0005] Further disclosed are methods of using one or more of the compounds disclosed herein, or a pharmaceutical composition thereof. The methods include methods of inhibiting sepiapterin reductase (SPR), methods of treating a subject suffering from pain, methods of treating a subject suffering from inflammation, and/or methods of treating a subject suffering from an immunological disorder.

[0006] These and other embodiments and features of the present invention will become apparent from the following detailed description of the preferred embodiments.

DETAILED DESCRIPTION

[0007] Disclosed herein are inhibitors of sepiapterin reductase (SPR) and uses of sepiapterin reductase inhibitors in analgesia, treatment of acute and chronic pain, anti-inflammation, and immune cell regulation. In mouse models, administration of an SPR inhibitor reduced pain hypersensitivity and BH4 levels in target tissues (Latremoliere et al., Neuron, 86:1393-1406 (2015)).

[0071] A "therapeutically effective amount" means an amount effective to treat or to prevent development of, or to alleviate the existing symptoms of, the subject being treated. Determination of the effective amounts is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein. Generally, a "therapeutically effective dose" refers to that amount of the compound that results in achieving the desired effect. For example, in one preferred embodiment, a therapeutically effective amount of a compound disclosed herein decreases SPR activity by at least 5%, compared to control, at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 55%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, or at least 90%.

[0072] The amount of compound administered can be dependent on the subject being treated, on the subject's age, health, sex, and weight, the kind of concurrent treatment (if any), severity of the affliction, the nature of the effect desired, the manner and frequency of treatment, and the judgment of the prescribing physician. The frequency of dosing also can be dependent on pharmacodynamic effects on arterial oxygen pressures. However, the most preferred dosage can be tailored to the individual subject, as is understood and determinable by one of skill in the art, without undue experimentation. This typically involves adjustment of a standard dose (e.g., reduction of the dose if the patient has a low body weight).

[0073] While individual needs vary, determination of optimal ranges of effective amounts of the compound is within the skill of the art. For administration to a human in the curative or prophylactic treatment of the conditions and disorders identified herein, for example, typical dosages of the compounds of the present invention can be about 0.05 mg/kg/day to about 50 mg/kg/day, for example at least 0.05 mg/kg, at least 0.08 mg/kg, at least 0.1 mg/kg, at least 0.2 mg/kg, at least 0.3 mg/kg, at least 0.4 mg/kg, or at least 0.5 mg/kg, and preferably 50 mg/kg or less, 40 mg/kg or less, 30 mg/kg or less, 20 mg/kg or less, or 10 mg/kg or less, which can be about 2.5 mg/day (0.5 mg/kg x 5kg) to about 5000 mg/day (50mg/kg x 100kg), for example. For example, dosages of the compounds can be about 0.1 mg/kg/day to about 50 mg/kg/day, about 0.05 mg/kg/day to about 10 mg/kg/day, about 0.05 mg/kg/day to about 5 mg/kg/day, about 0.05 mg/kg/day to about 3 mg/kg/day, about 0.07 mg/kg/day to about 3 mg/kg/day, about 0.09 mg/kg/day to about 3 mg/kg/day, about 0.05 mg/kg/day to about 0.1 mg/kg/day, about 0.1 mg/kg/day to about 1 mg/kg/day, about 1 mg/kg/day to about 10 mg/kg/day, about 1 mg/kg/day to about 5 mg/kg/day, about 1 mg/kg/day to about 3 mg/kg/day, about 3 mg/day to about 500 mg/day, about 5 mg/day to about 250 mg/day, about 10 mg/day to about 100 mg/day, about 3 mg/day to about 10 mg/day, or about 100 mg/day to

about 250 mg/day. Such doses may be administered in a single dose or it may be divided into multiple doses.

[0074] An SPR inhibitor is contemplated to be useful in the treatment of any condition wherein the lowering of BH4 levels will provide benefits. The SPR inhibitor is useful alone, or in combination with other compounds, which may act to promote the reduction of BH4 levels. The present section provides a description of how the SPR inhibitors of the invention may be therapeutically administered to a subject in need thereof.

[0075] One of the therapeutic embodiments of the invention is the provision, to a subject in need thereof, compositions comprising one or more SPR inhibitors. In one aspect, the SPR inhibitor formulation for therapy in a subject is selected based on the route of administration and in certain aspects includes liposome and micelle formulations as well as classic pharmaceutical preparations.

[0076] In various aspects, administration of the compositions is systemic or local, and in still other aspects comprises a single site injection of a therapeutically-effective amount of the SPR inhibitor composition. Any route known to those of skill in the art for the administration of a therapeutic composition of the invention is contemplated including, for example, intravenous, intramuscular, subcutaneous, oral, or a catheter for long-term administration.

[0077] Combination Therapy: In addition to therapies based solely on the delivery of the SPR inhibitor composition, combination therapy is specifically contemplated. In the context of the invention, it is contemplated that the SPR inhibitor composition therapy is used similarly in conjunction with other agents commonly used for the treatment of elevated levels of BH4 and/or SPR.

[0078] The combination therapy compositions are provided in a combined amount effective to produce the desired therapeutic outcome in the treatment of reduced levels of BH4 and/or make a detectable change in an indication as described herein. This process involves administering the SPR inhibitor and the second agent(s) or factor(s) at the same time. Methods thus include administering a single composition or pharmacological formulation that includes both agents, or administering two distinct compositions or formulations, at the same time, wherein one composition includes the SPR inhibitor therapeutic composition and the other includes the second therapeutic agent.

[0079] Alternatively, the SPR inhibitor treatment precedes or follows the second therapeutic agent treatment by intervals ranging from minutes to weeks. In embodiments where the second therapeutic agent and the SPR inhibitor are administered separately, one

generally ensures that a significant period of time did not transpire between the times of each delivery, such that the second therapeutic agent and the SPR inhibitor are able to exert an advantageously combined effect. In such instances, it is contemplated that one administers both modalities within about 12-24 hours of each other, or alternately, within about 6-12 hours of each other, or alternately, with a delay time of only about 12 hours. However, in some situations, it is desirable to extend the time period for treatment significantly, where several days (2, 3, 4, 5, 6 or 7) to several weeks (1, 2, 3, 4, 5, 6, 7 or 8) lapse between the respective administrations.

[0080] Systemic delivery of SPR inhibitors to patients is a very efficient method for delivering a therapeutically effective amount of the compound to counteract the immediate clinical manifestations of a disease or disorder. Alternatively, local delivery of the SPR inhibitor and/or the second therapeutic agent is appropriate in certain circumstances. In a certain embodiment, it is contemplated that the SPR inhibitor is delivered to a patient for an extended period of time. It is further contemplated that the SPR inhibitor is taken throughout a patient's lifetime to lower SPR activity levels.

Dosing and Pharmaceutical Formulations

[0081] Also provided herein are pharmaceutical compositions that includes a compound as disclosed herein, together with a pharmaceutically acceptable excipient such as a diluent or carrier. Compounds and pharmaceutical compositions suitable for use in the present invention include those wherein the compound can be administered in an effective amount to achieve its intended purpose. Administration of the compound described in more detail below.

[0082] Suitable pharmaceutical formulations can be determined by the skilled artisan depending on the route of administration and the desired dosage. *See, e.g.*, Remington's Pharmaceutical Sciences, 1435-712 (18th ed., Mack Publishing Co, Easton, Pennsylvania, 1990). [0087] Pharmaceutical compositions containing the compounds disclosed herein can be manufactured in a conventional manner, e.g., by conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping, or lyophilizing processes. Proper formulation is dependent upon the route of administration chosen.

[0088] For oral administration, suitable compositions can be formulated readily by combining a compound disclosed herein with pharmaceutically acceptable excipients such as carriers well known in the art. Such excipients and carriers enable the present compounds to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by adding a compound as disclosed herein with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients include, for example, fillers and cellulose preparations. If desired, disintegrating agents can be added. Pharmaceutically acceptable ingredients are well known for the various types of formulation and may be for example binders (e.g., natural or synthetic polymers), lubricants, surfactants, sweetening and flavoring agents, coating materials, preservatives, dyes, thickeners, adjuvants, antimicrobial agents, antioxidants and carriers for the various formulation types.

[0089] When a therapeutically effective amount of a compound disclosed herein is administered orally, the composition typically is in the form of a solid (e.g., tablet, capsule, pill, powder, or troche) or a liquid formulation (e.g., aqueous suspension, solution, elixir, or syrup).

[0090] When administered in tablet form, the composition can additionally contain a functional solid and/or solid carrier, such as a gelatin or an adjuvant. The tablet, capsule, and powder can contain about 1 to about 95% compound, and preferably from about 15 to about 90% compound.

[0091] When administered in liquid or suspension form, a functional liquid and/or a liquid carrier such as water, petroleum, or oils of animal or plant origin can be added. The liquid form of the composition can further contain physiological saline solution, sugar alcohol solutions, dextrose or other saccharide solutions, or glycols. When administered in liquid or suspension form, the composition can contain about 0.5 to about 90% by weight of a compound disclosed herein, and preferably about 1 to about 50% of a compound disclosed herein. In one embodiment contemplated, the liquid carrier is non-aqueous or substantially non-aqueous. For administration in liquid form, the composition may be supplied as a rapidly-dissolving solid formulation for dissolution or suspension immediately prior to administration.

[0092] When a therapeutically effective amount of a compound disclosed herein is administered by intravenous, cutaneous, or subcutaneous injection, the composition is in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such parenterally acceptable solutions, having due regard to pH, isotonicity, stability, and the like, is within the skill in the art. A preferred composition for intravenous, cutaneous, or subcutaneous injection typically contains, in addition to a compound disclosed herein, an isotonic vehicle. Such compositions may be prepared for administration as solutions of free base or pharmacologically acceptable salts in water suitably mixed with a surfactant, such as hydroxypropylcellulose. Dispersions also can be prepared in glycerol, liquid polyethylene glycols, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations can optionally contain a preservative to prevent the growth of microorganisms.

[0093] Injectable compositions can include sterile aqueous solutions, suspensions, or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions, suspensions, or dispersions. In all cases the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the conditions of

manufacture and storage and must resist the contaminating action of microorganisms, such as bacteria and fungi, by optional inclusion of a preservative. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol, propylene glycol, and liquid polyethylene glycol, and the like), suitable mixtures thereof, and vegetable oils. In one embodiment contemplated, the carrier is non-aqueous or substantially non-aqueous. The proper fluidity can be maintained, for example, by the use of a coating, such as lecithin, by the maintenance of the required particle size of the compound in the case of dispersion and by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

[0094] Sterile injectable solutions are prepared by incorporating the active compounds in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the various sterilized active ingredients into a sterile vehicle which contains the basic dispersion medium and the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum-drying and freeze-drying techniques which yield a powder of the active ingredient plus any additional desired ingredient from a previously sterile-filtered solution thereof.

[0095] Slow release or sustained release formulations may also be prepared in order to achieve a controlled release of the active compound in contact with the body fluids in the GI tract, and to provide a substantially constant and effective level of the active compound in the blood plasma. For example, release can be controlled by one or more of dissolution, diffusion, and ion-exchange. In addition, the slow release approach may enhance absorption via saturable or limiting pathways within the GI tract. For example, the compound may be embedded for this purpose in a polymer matrix of a biological degradable polymer, a water-soluble polymer or a mixture of both, and optionally suitable surfactants. Embedding can mean in this context the incorporation of micro-particles in a matrix of polymers. Controlled release formulations are also obtained through encapsulation of dispersed micro-particles or emulsified micro-droplets via known dispersion or emulsion coating technologies.

[0096] For administration by inhalation, compounds of the present invention are conveniently delivered in the form of an aerosol spray presentation from pressurized packs or a nebulizer, with the use of a suitable propellant. In the case of a pressurized aerosol, the dosage unit can be determined by providing a valve to deliver a metered amount. Capsules and cartridges of, e.g., gelatin, for use in an inhaler or insufflator can be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

[0097] The compounds disclosed herein can be formulated for parenteral administration by injection (e.g., by bolus injection or continuous infusion). Formulations for injection can be presented in unit dosage form (e.g., in ampules or in multidose containers), with an added preservative. The compositions can take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulatory agents such as suspending, stabilizing, and/or dispersing agents.

[0098] Pharmaceutical formulations for parenteral administration include aqueous solutions of the compounds in water-soluble form. Additionally, suspensions of the compounds can be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils or synthetic fatty acid esters. Aqueous injection suspensions can contain substances which increase the viscosity of the suspension. Optionally, the suspension also can contain suitable stabilizers or agents that increase the solubility of the compounds and allow for the preparation of highly concentrated solutions. Alternatively, a present composition can be in powder form for constitution with a suitable vehicle (e.g., sterile pyrogen-free water) before use.

[0099] Compounds disclosed herein also can be formulated in rectal compositions, such as suppositories or retention enemas (e.g., containing conventional suppository bases). In addition to the formulations described previously, the compounds also can be formulated as a depot preparation. Such long-acting formulations can be administered by implantation (e.g., subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds can be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

[00100] In particular, a compound disclosed herein can be administered orally, buccally, or sublingually in the form of tablets containing excipients, such as starch or lactose, or in capsules or ovules, either alone or in admixture with excipients, or in the form of elixirs or

suspensions containing flavoring or coloring agents. Such liquid preparations can be prepared with pharmaceutically acceptable additives, such as suspending agents. A compound also can be injected parenterally, for example, intravenously, intramuscularly, subcutaneously, or intracoronarily. For parenteral administration, the compound is best used in the form of a sterile aqueous solution which can contain other substances, for example, salts, or sugar alcohols, such as mannitol, or glucose, to make the solution isotonic with blood.

[00101] For veterinary use, a compound disclosed herein is administered as a suitably acceptable formulation in accordance with normal veterinary practice. The veterinarian can readily determine the dosing regimen and route of administration that is most appropriate for a particular animal.

[00102] In some cases, all the necessary components for the treatment of an SPR-related disorder using a compound as disclosed herein either alone or in combination with another agent or intervention traditionally used for the treatment of such disease may be packaged into a kit. Specifically, the present invention provides a kit for use in the therapeutic intervention of the disease comprising a packaged set of medicaments that include the compound disclosed herein as well as buffers and other components for preparing deliverable forms of said medicaments, and/or devices for delivering such medicaments, and/or any agents that are used in combination therapy with the compound disclosed herein, and/or instructions for the treatment of the disease packaged with the medicaments. The instructions may be fixed in any tangible medium, such as printed paper, or a computer readable magnetic or optical medium, or instructions to reference a remote computer data source such as a world wide web page accessible via the internet.

Scheme 15**Assessment of SPR Inhibitory Activity**

[00114] The compounds disclosed herein can be assessed for SPR inhibitory activity. Typically, a compound is assayed by an enzymatic assay (e.g., a TR-FRET assay) and/or a cellular assay (e.g., SKN-N-BE(2) cells or human PBMC (Peripheral Blood Mononuclear Cells)) as described below.

[00115] **TR-FRET Assay:** A TR-FRET (homogeneous, time-resolved, fluorescence resonance energy transfer) assay was used to assess activity of compounds following standard assay conditions. Terbium labeled SNAP-hSPR and SSZ (sulfasalazine) labeled SNAP-EGFP were used as the protein pair in this assay according to the procedure described in Haruki et al., Science, 430:987 (2013). Compounds were screened at different concentrations and IC_{50} values calculated.

[00116] **SKN-N-BE(2) Cellular Assay:** SK-N-BE (2) cells were seeded in sterile, 96-well plates and incubated for 12-24 hours at 37°C with 5% CO_2 supply. Media was removed and fresh DMEM/F-12 media (containing Glutamine & Pen/Strep but no FBS) was added. Compounds (at different concentrations) were added to different wells. The plates were then incubated for 6-48 hours at 37°C with 5% CO_2 supply. Plates were then centrifuged and the supernatant was removed. The plates were then optionally washed once with PBS. They were then sealed and stored at -80°C or immediately used. The cells were lysed and the level of BH4 was assessed by LC-MS.

[00117] **hPBMC Assay:** PBMCs were either purchased or isolated from fresh human blood and used either as a fresh preparation or frozen for later use. The assay system was prepared by pre-treating the assay plates overnight with a solution containing anti-human

CD3 antibody. Human PBMCs were suspended in assay medium and plated into the assay plates at a density of $1-4 \times 10^5$ cells per well. The desired concentration of the test compound was added to each well. A solution of human anti-CD28 antibody was also added to each well. Plates were incubated for 12-48 hours at 37° C and 5% CO₂. Assay plates were centrifuged for 5-15 minutes at 1-3000 RMP and supernatants were removed. The cells were lysed, sealed and used directly or frozen at -80° C. LC-MS was used to quantify the amount of inhibition of BH4 production.

Assessment of Pain Behavior

[00118] The compounds disclosed herein can be assessed for effect on pain behavior. Typically, a compound is assayed by a behavioral pharmacology model as described below.

[00119] Behavioral Pharmacology Model: Compounds were administered by oral gavage to rats that had undergone one of two nerve injury surgeries: spared nerve injury to injure two of the three peripheral branches of the sciatic nerve or chronic constriction injury of the sciatic nerve. Paw withdrawal thresholds to mechanical stimulation using calibrated von Frey filaments were used as measurement of neuropathic pain-like behaviors.

[00126] Step 1: Synthesis of 6-methyl-2-(methylsulfanyl)-3,4-dihydropyrimidin-4-one

[00128] To water (500 mL) was added NaOH (97%, 15.7 g, 381 mmol) and the suspension stirred at r.t. for 10 mins. 6-methyl-2-sulfanylidene-1,2,3,4-tetrahydropyrimidin-4-one (98%, 53.5 g, 369mmol) was added and the mixture stirred until fully dissolved for 10 mins. Iodomethane (28.99 mL, 461 mmol) was added dropwise and the mixture stirred at r.t. for 4 h. The colorless solid was filtered, washed with ice cold water (2 x 100 mL) and dried under vacuum at 60 °C to afford the title compound (57 g, 98%) as a colorless solid.

[00129] Method A: LC-MS m/z = 156.9 $[M + H]^+$; RT = 0.61 min.

[001027] To a solution of 5-methyl-1-(4-oxo-3,4-dihydropyrrolo[1,2-f][1,2,4]triazin-2-yl)-1H-pyrazole-4-carboxylic acid (50 mg, 0.193 mmol) and oxalyl dichloride (74 mg, 0.579 mmol) in DCM (8 mL) was added DMF (3 drops) at r.t. The mixture was stirred at r.t. for 2 h until the reaction was completed. The mixture was concentrated to give the crude product (80 mg) which was used to next step directly.

[001028] Step 2: Preparation of 2-(4-(2,2-dimethyl-4-(2,2,2-trifluoroethyl)piperazine-1-carbonyl)-5-methyl-1H-pyrazol-1-yl)pyrrolo[1,2-f][1,2,4]triazin-4(3H)-one

[001029]

[001030] A solution of 5-methyl-1-(4-oxo-3,4-dihydropyrrolo[1,2-f][1,2,4]triazin-2-yl)-1H-pyrazole-4-carbonyl chloride (80 mg, 0.288 mmol), 1-(2,2,2-trifluoroethyl)-3,3-dimethylpiperazine hydrochloride (74 mg, 0.317 mmol) and TEA (87 mg, 0.864 mmol) in DCM (8 mL) was stirred at r.t. overnight. The mixture was concentrated to remove

solvent, and the residue was purified with prep-HPLC (high pH) to the target. LC-MS (method F): $m/z = 438.1$ (M+H)⁺, RT = 1.67min.

Examples 296-299

[001031] Examples 296-299 in Table 21 were prepared in an analogous fashion to Example 295 starting with the corresponding starting materials.

Preparative Example 9 - Formation of Amines

Preparation of 4-(azetidin-3-yl)-2-fluoropyridine TFA salt:

[001033] Step 1: (1-(tert-butoxycarbonyl)azetidin-3-yl)zinc(II) iodide.

[001035] 1,2-Dibromoethane (1.992 g, 10.6 mmol) was added to the suspension of Zn (2.86 g, 44.1 mmol) in dry THF (40 mL) under N₂ atmosphere. The mixture was refluxed for 15 min and cooled to r.t. TMSCl (764 mg, 7.08 mmol) was added to the mixture slowly. After the addition, the mixture was stirred for 45 min at r.t. and then tert-butyl 3-iodoazetidine-1-carboxylate (5 g, 17.7 mmol) in dry THF (10 mL) was added. The mixture was stirred for 2 h at 40 °C to give the zinc reagent solution, which was used in next step directly.

[001036] Step 2: Synthesis of tert-butyl 3-(2-fluoropyridin-4-yl)azetidine-1-carboxylate.

[001038] 4-Bromo-2-fluoropyridine (3 g, 17.142 mmol) in THF (10 mL) was added to the mixture of Pd(dba)₃ (1.57 g, 1.714 mmol) and Pd(2-furyl)₃ (1.2 g, 5.143 mmol) under N₂ atmosphere. Then (1-(tert-butoxycarbonyl)azetidin-3-yl)zinc(II) iodide (7.2 g, 20.571 mmol) solution in THF (50 mL) was added. The mixture was stirred at 60 °C for 5 h. The reaction was quenched with H₂O (10 mL). The precipitate was filtered. The filtrate was extracted with EtOAc (30 mL x 2) and washed with water (200 mL). The combined organics were dried over Na₂SO₄. The solvent was then removed and the residue was purified by silica gel chromatography with CH₂Cl₂/MeOH: 50/1 to yield the product. LC-MS: m/z = 253 (M+H)⁺, RT = 1.457 min.

[001039] Step 3: Synthesis of 4-(azetidin-3-yl)-2-fluoropyridine TFA salt.

[001041] TFA (5 mL) was added to a solution of tert-butyl 3-(2-fluoropyridin-4-yl)azetidine-1-carboxylate (1.926 g, 7.634 mmol) in DCM (5 mL). The solution was stirred at

r.t. for 3 h. The solvent was removed from the reaction to yield the product which was used in the next step without further purification. LC-MS: $m/z = 153 (M+H)^+$.

Preparation 1-(3,3-difluorocyclobutyl)piperazine:

[001042] Step1: Synthesis of 1-benzyl-4-(3,3-difluorocyclobutyl)piperazine.

[001043]

[001044] To a 100 mL of RBF was added N-benzyl-2-chloro-N-(2-chloroethyl)ethanamine hydrochloride (2.3 g, 8.61 mmol), 3,3-difluorocyclobutanamine hydrochloride (1.0 g, 6.99 mmol), 20 mL of EtOH, and 6 mL of DIPEA. The mixture was stirred at reflux under N_2 for 16 h. The reaction mixture was concentrated and purified by combi flash (isco, silica gel, UV 254, 40 g, EA/PE=1/3) to give the product. LC-MS (UV 214) 267.2 ($M+H$) $^+$, $RT = 2.01$ min.

[001045] Step 2: Synthesis of 1-(3,3-difluorocyclobutyl)piperazine.

[001046]

[001047] To a 100 mL of RBF was added 1-benzyl-4-(3,3-difluorocyclobutyl)piperazine (1.0 g, 3.76 mmol), 30 mL of EtOAc, 0.05 mL of HOAc, and 400 mg of $Pd(OH)_2$. The mixture was stirred at r.t. under H_2 (2 atm) for 16 h. The reaction mixture was filtered and the filtrate was concentrated to give the title product. LC-MS (UV 214) 177.2 ($M+H$) $^+$, $RT = 1.17$ min.

Preparation of 1-(2,2-difluorocyclobutyl)piperazine hydrochloride:

[001048] Step 1: Synthesis of tert-butyl-4-(2-oxocyclobutyl)piperazine-1-carboxylate.

[001049]

[001050] To the solution of 1,2-bis(trimethylsilyloxy)cyclobut-1-ene (12.5 g, 54.24 mmol) in MeOH (40 mL) was added dropwise a solution of tert-butyl-piperazine-1-carboxylate (10.1 g, 54.24 mmol) in MeOH (60 mL) over 30 min. After addition, the reaction mixture was stirred at r.t. for 15 h. The mixture was concentrated and purified by SGC (eluting with DCM/MeOH=20/1) to get the title compound. LC-MS: $m/z = 199.1$ ($M-56$)⁺, $RT = 1.80$ min.

Example 954 - Assays of SPR Inhibitory Activity

[001097] Compounds were assayed for SPR inhibitory activity using a TR-FRET (homogeneous, time-resolved, fluorescence resonance energy transfer) assay according to the procedure described in Haruki et al., Science, 430:987 (2013). Terbium labelled SNAP-hSPR and SSZ (sulfasalazine) labelled SNAP-EGFP were used as the protein pair in this assay. Compounds were screened at different concentrations, and IC₅₀ and K_d values calculated. SPR inhibitory activity of the compounds is provided in Table 24.

[001098] Compounds were assayed for SPR inhibitory activity using a SKN-N-BE(2) cellular assay according to the following procedure. SK-N-BE (2) cells were seeded in sterile, 96-well plates and incubated for 12-24 hours at 37°C with 5% CO₂ supply. Media was removed and fresh DMEM/F-12 media (containing Glutamine & Pen/Strep but no FBS) was added. Compounds (at different concentrations) were added to different wells. The plates were then incubated for 6-48 hours at 37°C with 5% CO₂ supply. Plates were then centrifuged and the supernatant was removed. The plates were then optionally washed once with PBS. They were then sealed and stored at -80°C or immediately used in the next step. The cells were lysed and the levels of BH4 were assessed by LC-MS. SPR inhibitory activity of the compounds is provided in Table 24.

[001099] Compounds were assayed for inhibition of BH4 production using human peripheral blood mononuclear cells (PBMCs) according to the following procedure. PBMCs were either purchased or isolated from fresh human blood and used either as a fresh preparation or frozen for later use. The assay system was prepared by pre-treating the assay plates overnight with a solution containing anti-human CD3 antibody. Human PBMCs were suspended in assay medium and plated into the assay plates at a density of 1-4x10⁵ cells per well. The desired concentration of the test compound was added to each well. A solution of human anti-CD28 antibody was also added to each well. Plates are incubated for 12-48 hours at 37° C and 5% CO₂. Assay plates were centrifuged for 5-15 minutes at 1-3000 RMP and supernatants were removed. The cells were lysed, sealed and used directly or frozen at -80° C. LC-MS was used to quantify the amount of inhibition of BH4 production and is provided in Table 24.

Example 955 - Behavioral Pharmacology Models

[001100] Compounds were tested in standard behavioral pharmacology models for pain in rats as described in the literature (see, e.g., Latremoliere et al., Neuron, 86:1393-1406 (2015); Tegeder et al., Nature Medicine, 12:1269-1277 (2006)). Compounds were administered by oral gavage to rats that had undergone one of two nerve injury surgeries: spared nerve injury to injure two of the three peripheral branches of the sciatic nerve (SNI, Decosterd et al., Pain, 87:149-158 (2000)) or chronic constriction injury of the sciatic nerve (CCI, Bennett et al., Pain, 33:87-107 (1988)). Paw withdrawal thresholds to mechanical stimulation using calibrated von Frey filaments were used as measurement of neuropathic pain-like behaviors. Effect on pain behavior in these models is provided in Table 25.
